Signalling Data Link Interface (SDLI) Application Programming Interface

Version 0.9a Edition 8
Updated 2008-07-03
Distributed with Package strss7-0.9a.8

Abstract

This document is a Application Programming Interface containing technical details concerning the implementation of the Signalling Data Link Interface (SDLI) for OpenSS7. It contains recommendations on software architecture as well as platform and system applicability of the Signalling Data Link Interface (SDLI). It provides abstraction of the signalling data link interface to these components as well as providing a basis for signalling data link control for other signalling data link protocols.

Abstract

This document is a Application Programming Interface containing technical details concerning the implementation of the Signalling Data Link Interface (SDLI) for OpenSS7. It contains recommendations on software architecture as well as platform and system applicability of the Signalling Data Link Interface (SDLI).

This document specifies a Signalling Data Link Interface (SDLI) Specification in support of the OpenSS7 Signalling Data Link (SDL) protocol stacks. It provides abstraction of the signalling data link interface to these components as well as providing a basis for signalling data link control for other data link control protocols.

Purpose

The purpose of this document is to provide technical documentation of the Signalling Data Link Interface (SDLI). This document is intended to be included with the OpenSS7 *STREAMS* software package released by *OpenSS7 Corporation*. It is intended to assist software developers, maintainers and users of the Signalling Data Link Interface (SDLI) with understanding the software architecture and technical interfaces that are made available in the software package.

Intent

It is the intent of this document that it act as the primary source of information concerning the Signalling Data Link Interface (SDLI). This document is intended to provide information for writers of OpenSS7 Signalling Data Link Interface (SDLI) applications as well as writers of OpenSS7 Signalling Data Link Interface (SDLI) Users.

Audience

The audience for this document is software developers, maintainers and users and integrators of the Signalling Data Link Interface (SDLI). The target audience is developers and users of the OpenSS7 SS7 stack.

Disclaimer

Although the author has attempted to ensure that the information in this document is complete and correct, neither the Author nor OpenSS7 Corporation will take any responsibility in it.

Revision History

Take care that you are working with a current version of this documentation: you will not be notified of updates. To ensure that you are working with a current version, check the OpenSS7 Project website for a current version.

Only the texinfo or roff source is controlled. A printed (or postscript) version of this document is an **UNCONTROLLED VERSION**.

1 Introduction

This document specifies a *STREAMS*-based kernel-level instantiation of the ITU-T Signalling Data Link Interface (SDLI) definition. The Signalling Data Link Interface (SDLI) enables the user of a a signalling data link service to access and use any of a variety of conforming signalling data link providers without specific knowledge of the provider's protocol. The service interface is designed to support any network signalling data link protocol and user signalling data link protocol. This interface only specifies access to signalling data link service providers, and does not address issues concerning signalling data link management, protocol performance, and performance analysis tools.

This specification assumes that the reader is familiar with ITU-T state machines and signalling data link interfaces (e.g. Q.703, Q.2210), and *STREAMS*.

1.1 Related Documentation

— **ITU-T Recommendation Q.703 (White Book)**
— **ITU-T Recommendation Q.2210 (White Book)**
— **ANSI T1.111.3/2002**
— **System V Interface Definition, Issue 2 - Volume 3**

1.1.1 Role

This document specifies an interface that supports the services provided by the *Signalling System No. 7 (SS7)* for ITU-T, ANSI and ETSI applications as described in ITU-T Recommendation Q.703, ITU-T Recommendation Q.2210, ANSI T1.111.3, ETSI ETS 300 008-1. These specifications are targeted for use by developers and testers of protocol modules that require signalling data link service.

1.2 Definitions, Acronyms, Abbreviations

LM Local Management.

LMS Local Management Service.

LMS User A user of Local Management Services.

LMS Provider
A provider of Local Management Services.

Originating SDL User
A SDL-User that initiates a Signalling Data Link.

Destination SDL User
A SDL-User with whom an originating SDL user wishes to establish a Signalling Data Link.

ISO International Organization for Standardization

SDL User Kernel level protocol or user level application that is accessing the services of the Signalling Data Link sub-layer.

SDL Provider
: Signalling Data Link sub-layer entity/entities that provide/s the services of the Signalling Data Link interface.

SDLI
: Signalling Data Link Interface

TIDU
: Signalling Data Link Interface Data Unit

TSDU
: Signalling Data Link Service Data Unit

OSI
: Open Systems Interconnection

QOS
: Quality of Service

STREAMS
: A communication services development facility first available with UNIX System V Release 3.

2 The Signalling Data Link Layer

The Signalling Data Link Layer provides the means to manage the association of SDL-Users into connections. It is responsible for the routing and management of data to and from signalling data link connections between SDL-user entities.

2.1 Model of the SDLI

The SDLI defines the services provided by the signalling data link layer to the signalling data link user at the boundary between the signalling data link provider and the signalling data link user entity. The interface consists of a set of primitives defined as *STREAMS* messages that provide access to the signalling data link layer services, and are transferred between the SDLS user entity and the SDLS provider. These primitives are of two types; ones that originate from the SDLS user, and other that originate from the SDLS provider. The primitives that originate from the SDLS user make requests to the SDLS provider, or respond to an indication of an event of the SDLS provider. The primitives that originate from the SDLS provider are either confirmations of a request or are indications to the CCS user that an event has occurred. Figure 2.1 shows the model of the SDLI.

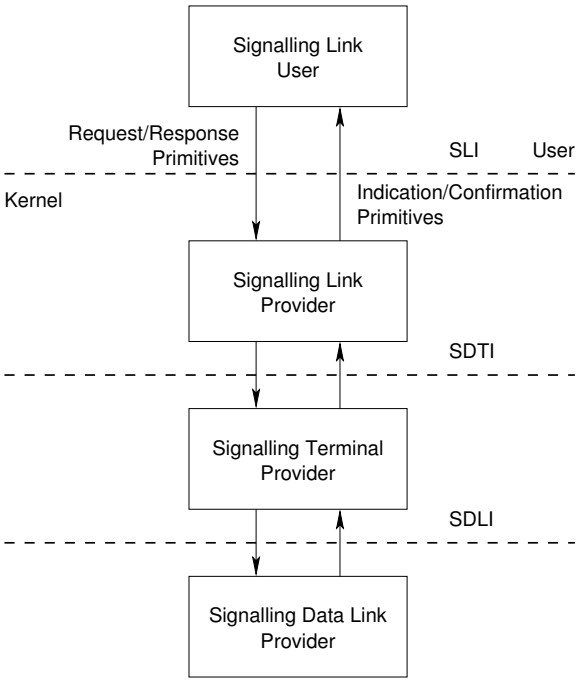

Figure 2.1: *Model of the SDLI*

The SDLI allows the SDLS provider to be configured with any signalling data link layer user (such as a signalling data terminal application) that also conforms to the SDLI. A signalling data link layer user can also be a user program that conforms to the SDLI and accesses the

SDLS provider via **putmsg**(2s) and **getmsg**(2s) system calls. The typical configuration, however, is to place a signalling data terminal module above the signalling data link layer.

2.2 SDLI Services

The features of the SDLI are defined in terms of the services provided by the SDLS provider, and the individual primitives that may flow between the SDLS user and the SDLS provider.

The SDLI Services are broken into two groups: local management services and protocol services. Local management services are responsible for the local management of streams, assignment of streams to physical points of attachment, enabling and disabling of streams, management of options associated with a stream, and general acknowledgement and event reporting for the stream. Protocol services consist of connecting a stream to a medium, exchanging bits with the medium, and disconnecting the stream from the medium.

2.2.1 Local Management

Local management services are listed in Table 2.1.

Phase	Service	Primitives
Local Management	Acknowledgement	LMI_OK_ACK, LMI_ERROR_ACK
	Information Reporting	LMI_INFO_REQ, LMI_INFO_ACK
	PPA Attachment	LMI_ATTACH_REQ, LMI_DETACH_REQ, LMI_OK_ACK
	Initialization	LMI_ENABLE_REQ, LMI_ENABLE_CON, LMI_DISABLE_REQ, LMI_DISABLE_CON
	Options Management	LMI_OPTMGMT_REQ, LMI_OPTMGMT_ACK
	Event Reporting	LMI_ERROR_IND, LMI_STATS_IND, LMI_EVENT_IND

Table 2.1: *Local Management Services*

The local management services interface is described in Section 3.1 [Local Management Services], page 9, and the primitives are detailed in Section 4.1 [Local Management Service Primitives], page 19. The local management services interface is defined by the '`ss7/lmi.h`' header file (see Appendix A [LMI Header File Listing], page 67).

2.2.2 Protocol

Protocol services are listed in Table 2.2.

Phase	Service	Primitives
Protocol	Connection	SDL_CONNECT_REQ
	Data Transfer	SDL_BITS_FOR_TRANSMISSION_REQ, SDL_RECEIVED_BITS_IND
	Disconnection	SDL_DISCONNECT_REQ, SDL_DISCONNECT_IND

Table 2.2: *Protocol Services*

The protocol services interface is described in Section 3.2 [Protocol Services], page 15, and the primitives are detailed in Section 4.2 [Protocol Service Primitives], page 58. The protocol services interface is defined by the '`ss7/sdli.h`' header file (see Appendix B [SDLI Header File Listing], page 75).

2.3 Purpose of the SDLI

The SDLI is typically implemented as a device driver controlling a TDM (Time Division Multiplexing) device that provides access to channels. The purpose behind exposing this low level interface is that almost all communications channel devices can be placed into a *raw* mode, where a bit stream can be exchanged between the driver and the medium. The SDLI provides a interface that, once implemented as a driver for a new device, can provide complete and verified SS7 signalling link capabilities by pushing generic SDT (Signalling Data Terminal) and SL (Signalling Link) modules over an open device stream.

This allows SDT and SL modules to be verified independently for correct operation and then simply used for all manner of new device drivers that can implement the SDLI interface.

3 SDLI Services Definition

3.1 Local Management Services

3.1.1 Acknowledgement Service

The acknowledgement service provides the LMS user with the ability to receive positive and negative acknowledgements regarding the successful or unsuccessful completion of services.

- `LMI_OK_ACK`: The `LMI_OK_ACK` message is used by the LMS provider to indicate successful receipt and completion of a service primitive request that requires positive acknowledgement.
- `LMI_ERROR_ACK`: The `LMI_ERROR_ACK` message is used by the LMS provider to indicate successful receipt and failure to complete a service primitive request that requires negative acknowledgement.

A successful invocation of the acknowledgement service is illustrated in Figure 3.1.

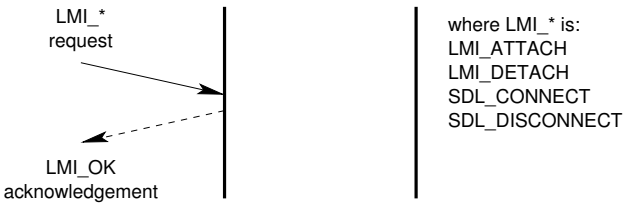

Figure 3.1: *Message Flow: Successful Acknowledgement Service*

As illustrated in Figure 3.1, the service primitives for which a positive acknowledgement may be returned are the `LMI_ATTACH_REQ` and `LMI_DETACH_REQ`.

An unsuccessful invocation of the acknowledgement service is illustrated in Figure 3.2.

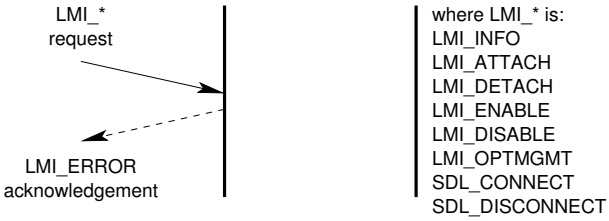

Figure 3.2: *Message Flow: Unsuccessful Acknowledgement Service*

As illustrated in Figure 3.2, the service primitives for which a negative acknowledgement may be returned are the `LMI_INFO_REQ`, `LMI_ATTACH_REQ`, `LMI_DETACH_REQ`, `LMI_ENABLE_REQ`, `LMI_DISABLE_REQ` and `LMI_OPTMGMT_REQ` messages.

3.1.2 Information Reporting Service

The information reporting service provides the LMS user with the ability to elicit information from the LMS provider.

- `LMI_INFO_REQ`: The `LMI_INFO_REQ` message is used by the LMS user to request information about the LMS provider.
- `LMI_INFO_ACK`: The `LMI_INFO_ACK` message is issued by the LMS provider to provide requested information about the LMS provider.

A successful invocation of the information reporting service is illustrated in Figure 3.3.

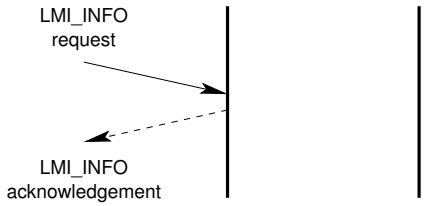

Figure 3.3: *Message Flow: Successful Information Reporting Service*

3.1.3 Physical Point of Attachment Service

The local management interface provides the LMS user with the ability to associate a stream to a physical point of appearance (*PPA*) or to disassociate a stream from a PPA. The local management interface provides for two styles of LMS provider:

Style 1 LMS Provider

A *Style 1* LMS provider is a provider that associates a stream with a PPA at the time of the first `open(2)` call for the device, and disassociates a stream from a PPA at the time of the last `close(2)` call for the device.

Physical points of attachment (PPA) are assigned to major and minor device number combinations. When the major and minor device number combination is opened, the opened stream is automatically associated with the PPA for the major and minor device number combination. The last close of the device disassociates the PPA from the stream.

Freshly opened *Style 1* LMS provider streams start life in the `LMI_DISABLED` state.

This approach is suitable for LMS providers implemented as real or pseudo-device drivers and is applicable when the number of minor devices is small and static.

Style 2 LMS Provider

A *Style 2* LMS provider is a provider that associates a stream with a PPA at the time that the LMS user issues the `LMI_ATTACH_REQ` message. Freshly opened streams are not associated with any PPA. The *Style 2* LMS provider stream is disassociated from a PPA when the stream is closed or when the LMS user issues the `LMI_DETACH_REQ` message.

Freshly opened *Style 2* LMS provider streams start life in the `LMI_UNATTACHED` state.

This approach is suitable for LMS providers implemented as clone real or pseudo-device drivers and is applicable when the number of minor devices is large or dynamic.

3.1.3.1 PPA Attachment Service

The PPA attachment service provides the LMS user with the ability to attach a *Style 2* LMS provider stream to a physical point of appearance (PPA).

- `LMI_ATTACH_REQ`: The `LMI_ATTACH_REQ` message is issued by the LMS user to request that a *Style 2* LMS provider stream be attached to a specified physical point of appearance (PPA).
- `LMI_OK_ACK`: Upon successful receipt and processing of the `LMI_ATTACH_REQ` message, the LMS provider acknowledges the success of the service completion with a `LMI_OK_ACK` message.
- `LMI_ERROR_ACK`: Upon successful receipt but failure to process the `LMI_ATTACH_REQ` message, the LMS provider acknowledges the failure of the service completion with a `LMI_ERROR_ACK` message.

A successful invocation of the attachment service is illustrated in Figure 3.4.

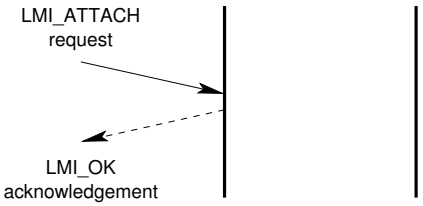

Figure 3.4: *Message Flow: Successful Attachment Service*

3.1.3.2 PPA Detachment Service

The PPA detachment service provides the LMS user with the ability to detach a *Style 2* LMS provider stream from a physical point of attachment (PPA).

- `LMI_DETACH_REQ`: The `LMI_DETACH_REQ` message is issued by the LMS user to request that a *Style 2* LMS provider stream be detached from the attached physical point of appearance (PPA).
- `LMI_OK_ACK`: Upon successful receipt and processing of the `LMI_DETACH_REQ` message, the LMS provider acknowledges the success of the service completion with a `LMI_OK_ACK` message.
- `LMI_ERROR_ACK`: Upon successful receipt but failure to process the `LMI_DETACH_REQ` message, the LMS provider acknowledges the failure of the service completion with a `LMI_ERROR_ACK` message.

A successful invocation of the detachment service is illustrated in Figure 3.5.

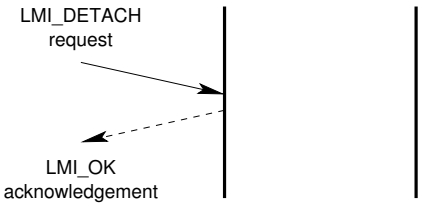

Figure 3.5: *Message Flow: Successful Detachment Service*

3.1.4 Initialization Service

The initialization service provides the LMS user with the abilty to enable and disable the stream for the associated PPA.

3.1.4.1 Interface Enable Service

The interface enable service provides the LMS user with the ability to enable an LMS provider stream that is associated with a PPA. Enabling the interface permits the LMS user to exchange protocol service interface messages with the LMS provider.

- `LMI_ENABLE_REQ`: The `LMI_ENABLE_REQ` message is issued by the LMS user to request that the protocol service interface be enabled.
- `LMI_ENABLE_CON`: Upon successful enabling of the protocol service interface, the LMS provider acknowledges successful completion of the service by issuing a `LMI_ENABLE_CON` message to the LMS user.
- `LMI_ERRORK_ACK`: Upon unsuccessful enabling of the protocol service interface, the LMS provider acknowledges the failure to complete the service by issuing an `LMI_ERROR_ACK` message to the LMS user.

A successful invocation of the enable service is illustrated in Figure 3.6.

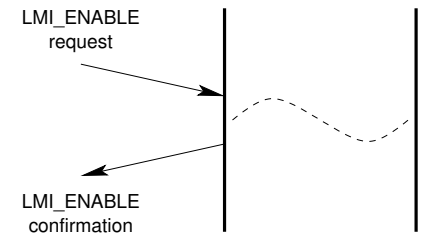

Figure 3.6: *Message Flow: Successful Enable Service*

3.1.4.2 Interface Disable Service

The interface disable service provides the LMS user with the ability to disable an LMS provider stream that is associated with a PPA. Disabling the interface withdraws the LMS user's ability to exchange protocol service interface messages with the LMS provider.

- `LMI_DISABLE_REQ`: The `LMI_DISABLE_REQ` message is issued by the LMS user to request that the protocol service interface be disabled.
- `LMI_DISABLE_CON`: Upon successful disabling of the protocol service interface, the LMS provider acknowledges successful completion of the service by issuing a `LMI_DISABLE_CON` message to the LMS user.
- `LMI_ERRORK_ACK`: Upon unsuccessful disabling of the protocol service interface, the LMS provider acknowledges the failure to complete the service by issuing an `LMI_ERROR_ACK` message to the LMS user.

A successful invocation of the disable service is illustrated in Figure 3.7.

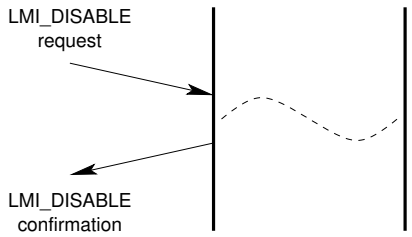

Figure 3.7: *Message Flow: Successful Disable Service*

3.1.5 Options Management Service

The options management service provides the LMS user with the ability to control and affect various generic and provider-specific options associated with the LMS provider.

- `LMI_OPTMGMT_REQ`: The LMS user issues a `LMI_OPTMGMT_REQ` message when it wishes to interrogate or affect the setting of various generic or provider-specific options associated with the LMS provider for the stream upon which the message is issued.
- `LMI_OPTMGMT_ACK`: Upon successful receipt of the `LMI_OPTMGMT_REQ` message, and successful options processing, the LMS provider acknowledges the successful completion of the service with an `LMI_OPTMGMT_ACK` message.
- `LMI_ERROR_ACK`: Upon successful receipt of the `LMI_OPTMGMT_REQ` message, and unsuccessful options processing, the LMS provider acknowledges the failure to complete the service by issuing an `LMI_ERROR_ACK` message to the LMS user.

A successful invocation of the options management service is illustrated in Figure 3.8.

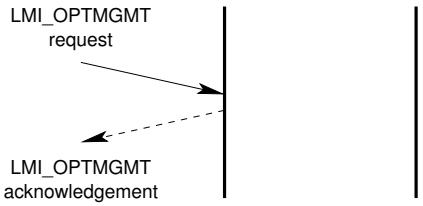

Figure 3.8: *Message Flow: Successful Options Management Service*

3.1.6 Error Reporting Service

The error reporting service provides the LMS provider with the ability to indicate asynchronous errors to the LMS user.

- `LMI_ERROR_IND`: The LMS provider issues the `LMI_ERROR_IND` message to the LMS user when it needs to indicate an asynchronous error (such as the unusability of the communications medium).

A successful invocation of the error reporting service is illustrated in Figure 3.9.

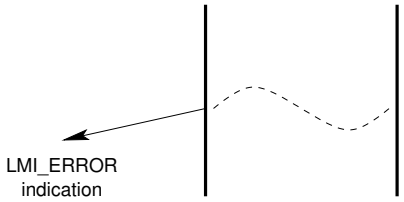

Figure 3.9: *Message Flow: Successful Error Reporting Service*

3.1.7 Statistics Reporting Service

- `LMI_STATS_IND`:

A successful invocation of the statistics reporting service is illustrated in Figure 3.10.

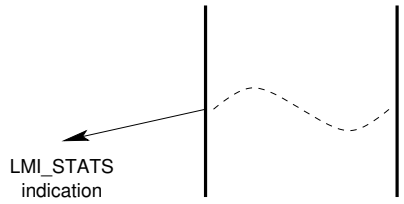

Figure 3.10: *Message Flow: Successful Statistics Reporting Service*

3.1.8 Event Reporting Service

The event reporting service provides the LMS provider with the ability to indicate specific asynchronous management events to the LMS user.

- `LMI_EVENT_IND`: The LMS provider issues the `LMI_EVENT_IND` message to the LMS user when it wishes to indicate an asynchronous (management) event to the LMS user.

A successful invocation of the event reporting service is illustrated in Figure 3.11.

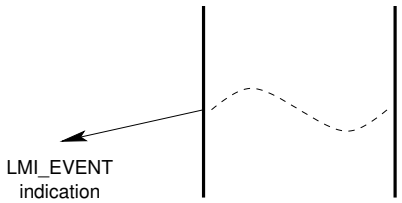

Figure 3.11: *Message Flow: Successful Event Reporting Service*

3.2 Protocol Services

Protocol services are specific to the Signalling Data Link interface. These services consist of connection services that permit the transmit and receive directions to be connected to or disconnected from the medium, and data transfer services that permit the exchange of bits between SDLS users.

The service primitives that implement the protocol services are described in detail in Section 4.2 [Protocol Service Primitives], page 58.

3.2.1 Connection Service

The connection service provides the ability for the SDLS user to connect to the medium for the purpose of transmitting bits, receiving bits, or both. In SS7, this is a Level 1 function, possibly the responsibility of multiplex or digital cross-connect switch.

- `SDL_CONNECT_REQ`: The `SDL_CONNECT_REQ` message is used by the SDLS user to request that the stream be connected to the medium. Connection to the medium might require some switching or other mechanism to prepare the stream for data transmission and receiption. Connections can be formed for the receive direction or the transmit direction independently.

A successful invocation of the connection service is illustrated in Figure 3.12.

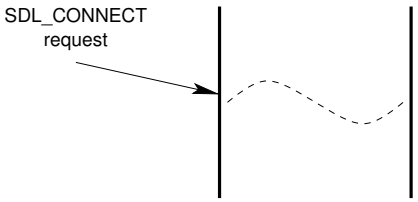

Figure 3.12: *Message Flow: Successful Connection Service*

3.2.2 Data Transfer Service

The data transfer service provides the SDLS user with the ability to request that bits be transmitted on the medium, and the SDLS provider with the ability to indicate bits that have been received from the medium.

- `SDL_BITS_FOR_TRANSMISSION_REQ`: The `SDL_BITS_FOR_TRANSMISSION_REQ` message is used by the SDLS user to place raw bits onto the medium. The stream must have first been successfully activated in the transmit direction using the `SDL_CONNECT_REQ` message.
- `SDL_RECEIVED_BITS_IND`: The `SDL_RECEIVED_BITS_IND` message is issued by the SDLS provider when activated for the receive direction with the `SDL_CONNECT_REQ` message, to indicate bits received on the medium.

A successful invocation of the data transfer service is illustrated in Figure 3.13.

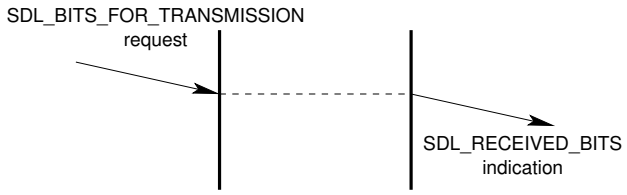

Figure 3.13: *Message Flow: Successful Data Transfer Service*

3.2.3 Disconnection Service

The disconnection service provides the ability for the SDLS user to disconnect from the medium, withdrawing from the purpose of transmitting bits, receiving bits, or both. It allow allows the SDLS provider to autonomously indicate that the medium has been disconnected from the stream. In SS7, this is a Level 1 function, possible the responsibility of a multiplex or digital cross-connect switch.

- `SDL_DISCONNECT_REQ`: The `SDL_DISCONNECT_REQ` message is used by the SDLS user to request that the stream be disconnected from the medium. Disconnection from the medium might require some switching or other mechanism. Disconnection can be perofrmed for the receive direction or the transmit direction independently.

- `SDL_DISCONNECT_IND`: The `SDL_DISCONNECT_IND` message is used by the SDLS provider to indicate to the SDLS user that the stream has been disconnected from the medium. Disconnection is indicated for both the receive and transmit directions.

A successful invocation of the disconnection service by the SDLS user is illustrated in Figure 3.14.

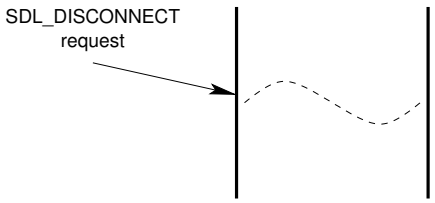

Figure 3.14: *Message Flow: Successful Disconnection Service by SDLS User*

A successful invocation of the disconnection service by the SDLS provider is illustrated in Figure 3.15.

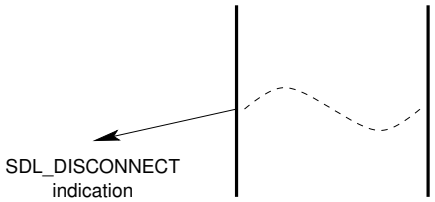

Figure 3.15: *Message Flow: Successful Disconnection Service by SDLS Provider*

4 SDLI Primitives

4.1 Local Management Service Primitives

These service primitives implement the local management services (see Section 3.1 [Local Management Services], page 9).

4.1.1 Acknowledgement Service Primitives

These service primitives implement the acknowledgement service (see Section 3.1.1 [Acknowledgement Service], page 9).

4.1.1.1 LMI_OK_ACK

Description

This primitive is used to acknowledge receipt and successful service completion for primitives requiring acknowledgement that have no confirmation primitive.

Format

This primitive consists of one `M_PCPROTO` message block, structured as follows:

```
typedef struct {
    lmi_long lmi_primitive;
    lmi_long lmi_correct_primitive;
    lmi_ulong lmi_state;
} lmi_ok_ack_t;
```

Parameters

The service primitive contains the following parameters:

`lmi_primitive`
: Indicates the service primitive type. Always `LMI_OK_ACK`.

`lmi_correct_primitive`
: Indicates the service primitive that was received and serviced correctly. This field can be one of the following values:

  `LMI_ATTACH_REQ`
  : Attach request.

  `LMI_DETACH_REQ`
  : Detach request.

`lmi_state`
: Indicates the current state of the LMS provider at the time that the primitive was issued. This field can be one of the following values:

  `LMI_UNATTACHED`
  : No PPA attached, awaiting `LMI_ATTACH_REQ`.

`LMI_UNUSABLE`
: Device cannot be used, STREAM in hung state.

`LMI_DISABLED`
: PPA attached, awaiting `LMI_ENABLE_REQ`.

`LMI_ENABLED`
: Ready for use, awaiting primitive exchange.

State

This primitive is issued by the LMS provider in the `LMI_ATTACH_PENDING` or `LMI_DETACH_PENDING` state.

New State

The new state is `LMI_UNATTACHED` or `LMI_DISABLED`, depending on thee primitive to which the message is responding.

4.1.1.2 LMI_ERROR_ACK

Description

The error acknowledgement primitive is used to acknowledge receipt and unsuccessful service completion for primitives requiring acknowledgement.

Format

The error acknowledgement primitive consists of one `M_PCPROTO` message block, structured as follows:

```
typedef struct {
    lmi_long lmi_primitive;
    lmi_ulong lmi_errno;
    lmi_ulong lmi_reason;
    lmi_long lmi_error_primitive;
    lmi_ulong lmi_state;
} lmi_error_ack_t;
```

Parameters

The error acknowledgement primitive contains the following parameters:

`lmi_primitive`
: Indicates the primitive type. Always `LMI_ERROR_ACK`.

`lmi_errno`
: Indicates the LM error number. This field can have one of the following values:

  `LMI_UNSPEC`
  : Unknown or unspecified.

  `LMI_BADADDRESS`
  : Address was invalid.

  `LMI_BADADDRTYPE`
  : Invalid address type.

  `LMI_BADDIAL`
  : (Not used.)

  `LMI_BADDIALTYPE`
  : (Not used.)

  `LMI_BADDISPOSAL`
  : Invalid disposal parameter.

  `LMI_BADFRAME`
  : Defective SDU received.

  `LMI_BADPPA`
  : Invalid PPA identifier.

`LMI_BADPRIM`
: Unrecognized primitive.

`LMI_DISC` Disconnected.

`LMI_EVENT`
: Protocol-specific event occurred.

`LMI_FATALERR`
: Device has become unusable.

`LMI_INITFAILED`
: Link initialization failed.

`LMI_NOTSUPP`
: Primitive not supported by this device.

`LMI_OUTSTATE`
: Primitive was issued from invalid state.

`LMI_PROTOSHORT`
: `M_PROTO` block too short.

`LMI_SYSERR`
: UNIX system error.

`LMI_WRITEFAIL`
: Unitdata request failed.

`LMI_CRCERR`
: CRC or FCS error.

`LMI_DLE_EOT`
: DLE EOT detected.

`LMI_FORMAT`
: Format error detected.

`LMI_HDLC_ABORT`
: Aborted frame detected.

`LMI_OVERRUN`
: Input overrun.

`LMI_TOOSHORT`
: Frame too short.

`LMI_INCOMPLETE`
: Partial frame received.

`LMI_BUSY` Telephone was busy.

`LMI_NOANSWER`
: Connection went unanswered.

`LMI_CALLREJECT`
: Connection rejected.

`LMI_HDLC_IDLE`
: HDLC line went idle.

`LMI_HDLC_NOTIDLE`
: HDLC link no longer idle.

`LMI_QUIESCENT`
: Line being reassigned.

`LMI_RESUMED`
: Line has been reassigned.

`LMI_DSRTIMEOUT`
: Did not see DSR in time.

`LMI_LAN_COLLISIONS`
: LAN excessive collisions.

`LMI_LAN_REFUSED`
: LAN message refused.

`LMI_LAN_NOSTATION`
: LAN no such station.

`LMI_LOSTCTS`
: Lost Clear to Send signal.

`LMI_DEVERR`
: Start of device-specific error codes.

`lmi_reason`
: Indicates the reason for failure. This field is protocol-specific. When the `lmi_errno` field is `LMI_SYSERR`, the `lmi_reason` field is the UNIX error number as described in `errno(3)`.

`lmi_error_primitive`
: Indicates the primitive that was in error. This field can have one of the following values:

`LMI_INFO_REQ`
: Information request.

`LMI_ATTACH_REQ`
: Attach request.

`LMI_DETACH_REQ`
: Detach request.

`LMI_ENABLE_REQ`
: Enable request.

`LMI_DISABLE_REQ`
: Disable request.

`LMI_OPTMGMT_REQ`
: Options management request.

`LMI_INFO_ACK`
: Information acknowledgement.

`LMI_OK_ACK`
: Successful receipt acknowledgement.

`LMI_ERROR_ACK`
: Error acknowledgement.

`LMI_ENABLE_CON`
: Enable confirmation.

`LMI_DISABLE_CON`
: Disable confirmation.

`LMI_OPTMGMT_ACK`
: Options Management acknowledgement.

`LMI_ERROR_IND`
: Error indication.

`LMI_STATS_IND`
: Statistics indication.

`LMI_EVENT_IND`
: Event indication.

`lmi_state`
: Indicates the state of the LMS provider at the time that the primitive was issued. This field can have one of the following values:

`LMI_UNATTACHED`
: No PPA attached, awaiting `LMI_ATTACH_REQ`.

`LMI_ATTACH_PENDING`
: Waiting for attach.

`LMI_UNUSABLE`
: Device cannot be used, STREAM in hung state.

`LMI_DISABLED`
: PPA attached, awaiting `LMI_ENABLE_REQ`.

`LMI_ENABLE_PENDING`
: Waiting to send `LMI_ENABLE_CON`.

`LMI_ENABLED`
: Ready for use, awaiting primitive exchange.

`LMI_DISABLE_PENDING`
: Waiting to send `LMI_DISABLE_CON`.

`LMI_DETACH_PENDING`
: Waiting for detach.

State

This primitive can be issued in any state for which a local acknowledgement is not pending. The LMS provider state at the time that the primitive was issued is indicated in the primitive.

New State

The new state remains unchanged.

4.1.2 Information Reporting Service Primitives

These service primitives implement the information reporting service (see Section 3.1.2 [Information Reporting Service], page 10).

4.1.2.1 LMI_INFO_REQ

Description

This LMS user originated primitive is issued by the LMS user to request that the LMS provider return information concerning the capabilities and state of the LMS provider.

Format

The primitive consists of one `M_PROTO` or `M_PCPROTO` message block, structured as follows:

```
typedef struct {
    lmi_ulong lmi_primitive;
} lmi_info_req_t;
```

Parameters

This primitive contains the following parameters:

`lmi_primitive`
: Specifies the primitive type. Always `LMI_INFO_REQ`.

State

This primitive may be issued in any state but only when a local acknowledgement is not pending.

New State

The new state remains unchanged.

Response

This primitive requires the LMS provider to acknowledge receipt of the primitive as follows:

- **Successful**: The LMS provider is required to acknowledge receipt of the primitive and provide the requested information using the `LMI_INFO_ACK` primitive.
- **Unsuccessful (non-fatal errors)**: The LMS provider is required to negatively acknowledge the primitive using the `LMI_ERROR_ACK` primitive, and include the reason for failure in the primitive.

Reasons for Failure

Non-Fatal Errors: applicable non-fatal errors are as follows:

`LMI_UNSPEC`
: Unknown or unspecified.

`LMI_BADADDRESS`
: Address was invalid.

`LMI_BADADDRTYPE`
: Invalid address type.

`LMI_BADDIAL`
: (Not used.)

`LMI_BADDIALTYPE`
: (Not used.)

`LMI_BADDISPOSAL`
: Invalid disposal parameter.

`LMI_BADFRAME`
: Defective SDU received.

`LMI_BADPPA`
: Invalid PPA identifier.

`LMI_BADPRIM`
: Unrecognized primitive.

`LMI_DISC` Disconnected.

`LMI_EVENT`
: Protocol-specific event occurred.

`LMI_FATALERR`
: Device has become unusable.

`LMI_INITFAILED`
: Link initialization failed.

`LMI_NOTSUPP`
: Primitive not supported by this device.

`LMI_OUTSTATE`
: Primitive was issued from invalid state.

`LMI_PROTOSHORT`
: `M_PROTO` block too short.

`LMI_SYSERR`
: UNIX system error.

`LMI_WRITEFAIL`
: Unitdata request failed.

`LMI_CRCERR`
: CRC or FCS error.

`LMI_DLE_EOT`
: DLE EOT detected.

`LMI_FORMAT`
: Format error detected.

`LMI_HDLC_ABORT`
: Aborted frame detected.

`LMI_OVERRUN`
: Input overrun.

`LMI_TOOSHORT`
: Frame too short.

`LMI_INCOMPLETE`
: Partial frame received.

`LMI_BUSY` Telephone was busy.

`LMI_NOANSWER`
: Connection went unanswered.

`LMI_CALLREJECT`
: Connection rejected.

`LMI_HDLC_IDLE`
: HDLC line went idle.

`LMI_HDLC_NOTIDLE`
: HDLC link no longer idle.

`LMI_QUIESCENT`
: Line being reassigned.

`LMI_RESUMED`
: Line has been reassigned.

`LMI_DSRTIMEOUT`
: Did not see DSR in time.

`LMI_LAN_COLLISIONS`
: LAN excessive collisions.

`LMI_LAN_REFUSED`
: LAN message refused.

`LMI_LAN_NOSTATION`
: LAN no such station.

`LMI_LOSTCTS`
: Lost Clear to Send signal.

`LMI_DEVERR`
: Start of device-specific error codes.

4.1.2.2 LMI_INFO_ACK

Description

This LMS provider originated primitive acknowledges receipt and successful processing of the LMI_INFO_REQ primitive and provides the request information concerning the LMS provider.

Format

This message is formatted a one M_PROTO or M_PCPROTO message block, structured as follows:

```
typedef struct {
    lmi_long lmi_primitive;
    lmi_ulong lmi_version;
    lmi_ulong lmi_state;
    lmi_ulong lmi_max_sdu;
    lmi_ulong lmi_min_sdu;
    lmi_ulong lmi_header_len;
    lmi_ulong lmi_ppa_style;
    lmi_uchar lmi_ppa_addr[0];
} lmi_info_ack_t;
```

Parameters

The information acknowledgement service primitive has the following parameters:

lmi_primitive
: Indicates the service primitive type. Always LMI_INFO_ACK.

lmi_version
: Indicates the version of this specification that is being used by the LMS provider.

lmi_state
: Indicates the state of the LMS provider at the time that the information acknowledgement service primitive was issued. This field can be one of the following values:

  LMI_UNATTACHED
  : No PPA attached, awaiting LMI_ATTACH_REQ.

  LMI_ATTACH_PENDING
  : Waiting for attach.

  LMI_UNUSABLE
  : Device cannot be used, STREAM in hung state.

  LMI_DISABLED
  : PPA attached, awaiting LMI_ENABLE_REQ.

  LMI_ENABLE_PENDING
  : Waiting to send LMI_ENABLE_CON.

`LMI_ENABLED`
: Ready for use, awaiting primitive exchange.

`LMI_DISABLE_PENDING`
: Waiting to send `LMI_DISABLE_CON`.

`LMI_DETACH_PENDING`
: Waiting for detach.

`lmi_max_sdu`
: Indicates the maximum size of a Service Data Unit.

`lmi_min_sdu`
: Indicates the minimum size of a Service Data Unit.

`lmi_header_len`
: Indicates the amount of header space that should be reserved for placing LMS provider headers.

`lmi_ppa_style`
: Indicates the PPA style of the LMS provider. This value can be one of the following values:

  `LMI_STYLE1`
  : PPA is implicitly attached by `open(2)`.

  `LMI_STYLE2`
  : PPA must be explicitly attached using `LMI_ATTACH_REQ`.

`lmi_ppa_addr`
: This is a variable length field. The length of the field is determined by the length of the `M_PROTO` or `M_PCPROTO` message block.

  For a *Style 2* driver, when `lmi_ppa_style` is `LMI_STYLE2`, and when in an attached state, this field providers the current PPA associated with the stream; the length is typically 4 bytes.

  For a *Style 1* driver, when `lmi_ppa_style` is `LMI_STYLE1`, the length it 0 bytes.

State

This primitive can be issued in any state where a local acknowledgement is not pending.

New State

The new state remains unchanged.

4.1.3 Physical Point of Attachment Service Primitives

These service primitives implement the physical point of attachment service (see Section 3.1.3 [Physical Point of Attachment Service], page 10).

4.1.3.1 LMI_ATTACH_REQ

Description

This LMS user originated primitive requests that the stream upon which the primitive is issued by associated with the specified Physical Point of Attachment (PPA). This primitive is only applicable to *Style 2* LMS provider streams, that is, streams that return `LMI_STYLE2` in the `lmi_ppa_style` field of the `LMI_INFO_ACK`.

Format

This primitive consists of one `M_PROTO` message block, structured as follows:

```
typedef struct {
    lmi_long lmi_primitive;
    lmi_uchar lmi_ppa[0];
} lmi_attach_req_t;
```

Parameters

The attach request primitive contains the following parameters:

`lmi_primitive`
: Specifies the service primitive type. Always `LMI_ATTACH_REQ`.

`lmi_ppa`
: Specifies the Physical Point of Attachment (PPA) to which to associated the *Style 2* stream. This is a variable length identifier whose length is determined by the length of the `M_PROTO` message block.

State

This primitive is only valid in state `LMI_UNATTACHED` and when a local acknowledgement is not pending.

New State

Upon success, the new state is `LMI_ATTACH_PENDING`. Upon failure, the state remains unchanged.

Response

The attach request service primitive requires that the LMS provider respond as follows:

- **Successful**: The LMS provider acknowledges receipt of the primitive and successful outcome of the attach service with a `LMI_OK_ACK` primitive. The new state is `LMI_DISABLED`.
- **Unsuccessful (non-fatal errors)**: The LMS provider acknowledges receipt of the primitive and failure of the attach service with a `LMI_ERROR_ACK` primitive containing the reason for failure. The new state remains unchanged.

Reasons for Failure

Non-Fatal Errors: applicable non-fatal errors are as follows:

`LMI_UNSPEC`
: Unknown or unspecified.

`LMI_BADADDRESS`
: Address was invalid.

`LMI_BADADDRTYPE`
: Invalid address type.

`LMI_BADDIAL`
: (Not used.)

`LMI_BADDIALTYPE`
: (Not used.)

`LMI_BADDISPOSAL`
: Invalid disposal parameter.

`LMI_BADFRAME`
: Defective SDU received.

`LMI_BADPPA`
: Invalid PPA identifier.

`LMI_BADPRIM`
: Unrecognized primitive.

`LMI_DISC` Disconnected.

`LMI_EVENT`
: Protocol-specific event occurred.

`LMI_FATALERR`
: Device has become unusable.

`LMI_INITFAILED`
: Link initialization failed.

`LMI_NOTSUPP`
: Primitive not supported by this device.

`LMI_OUTSTATE`
: Primitive was issued from invalid state.

`LMI_PROTOSHORT`
: `M_PROTO` block too short.

`LMI_SYSERR`
: UNIX system error.

`LMI_WRITEFAIL`
: Unitdata request failed.

`LMI_CRCERR`
: CRC or FCS error.

`LMI_DLE_EOT`
: DLE EOT detected.

`LMI_FORMAT`
: Format error detected.

`LMI_HDLC_ABORT`
: Aborted frame detected.

`LMI_OVERRUN`
: Input overrun.

`LMI_TOOSHORT`
: Frame too short.

`LMI_INCOMPLETE`
: Partial frame received.

`LMI_BUSY` Telephone was busy.

`LMI_NOANSWER`
: Connection went unanswered.

`LMI_CALLREJECT`
: Connection rejected.

`LMI_HDLC_IDLE`
: HDLC line went idle.

`LMI_HDLC_NOTIDLE`
: HDLC link no longer idle.

`LMI_QUIESCENT`
: Line being reassigned.

`LMI_RESUMED`
: Line has been reassigned.

`LMI_DSRTIMEOUT`
: Did not see DSR in time.

`LMI_LAN_COLLISIONS`
: LAN excessive collisions.

`LMI_LAN_REFUSED`
: LAN message refused.

`LMI_LAN_NOSTATION`
: LAN no such station.

`LMI_LOSTCTS`
: Lost Clear to Send signal.

`LMI_DEVERR`
: Start of device-specific error codes.

4.1.3.2 LMI_DETACH_REQ

Description

This LMS user originated primitive request that the stream upon which the primitive is issued be disassociated from the Physical Point of Appearance (PPA) to which it is currently attached. This primitive is only applicable to *Style 2* LMS provider streams, that is, streams that return `LMI_STYLE2` in the `lmi_ppa_style` field of the `LMI_INFO_ACK`.

Format

The detach request service primitive consists of one `M_PROTO` message block, structured as follows:

```
typedef struct {
    lmi_long lmi_primitive;
} lmi_detach_req_t;
```

Parameters

The detach request service primitive contains the following parameters:

`lmi_primitive`
: Specifies the service primitive type. Always `LMI_DETACH_REQ`.

State

This primitive is valid in the `LMI_DISABLED` state and when no local acknowledgement is pending.

New State

Upon success, the new state is `LMI_DETACH_PENDING`. Upon failure, the state remains unchanged.

Response

The detach request service primitive requires that the LMS provider respond as follows:

- **Successful**: The LMS provider acknowledges receipt of the primitive and successful outcome of the detach service with a `LMI_OK_ACK` primitive. The new state is `LMI_UNATTACHED`.
- **Unsuccessful (non-fatal errors)**: The LMS provider acknowledges receipt of the primitive and failure of the detach service with a `LMI_ERROR_ACK` primitive containing the reason for failure. The new state remains unchanged.

Reasons for Failure

Non-Fatal Errors: applicable non-fatal errors are as follows:

`LMI_UNSPEC`
: Unknown or unspecified.

`LMI_BADADDRESS`
: Address was invalid.

`LMI_BADADDRTYPE`
: Invalid address type.

`LMI_BADDIAL`
: (Not used.)

`LMI_BADDIALTYPE`
: (Not used.)

`LMI_BADDISPOSAL`
: Invalid disposal parameter.

`LMI_BADFRAME`
: Defective SDU received.

`LMI_BADPPA`
: Invalid PPA identifier.

`LMI_BADPRIM`
: Unrecognized primitive.

`LMI_DISC` Disconnected.

`LMI_EVENT`
: Protocol-specific event occurred.

`LMI_FATALERR`
: Device has become unusable.

`LMI_INITFAILED`
: Link initialization failed.

`LMI_NOTSUPP`
: Primitive not supported by this device.

`LMI_OUTSTATE`
: Primitive was issued from invalid state.

`LMI_PROTOSHORT`
: `M_PROTO` block too short.

`LMI_SYSERR`
: UNIX system error.

`LMI_WRITEFAIL`
: Unitdata request failed.

`LMI_CRCERR`
: CRC or FCS error.

`LMI_DLE_EOT`
: DLE EOT detected.

`LMI_FORMAT`
: Format error detected.

`LMI_HDLC_ABORT`
: Aborted frame detected.

`LMI_OVERRUN`
: Input overrun.

`LMI_TOOSHORT`
: Frame too short.

`LMI_INCOMPLETE`
: Partial frame received.

`LMI_BUSY` Telephone was busy.

`LMI_NOANSWER`
: Connection went unanswered.

`LMI_CALLREJECT`
: Connection rejected.

`LMI_HDLC_IDLE`
: HDLC line went idle.

`LMI_HDLC_NOTIDLE`
: HDLC link no longer idle.

`LMI_QUIESCENT`
: Line being reassigned.

`LMI_RESUMED`
: Line has been reassigned.

`LMI_DSRTIMEOUT`
: Did not see DSR in time.

`LMI_LAN_COLLISIONS`
: LAN excessive collisions.

`LMI_LAN_REFUSED`
: LAN message refused.

`LMI_LAN_NOSTATION`
: LAN no such station.

`LMI_LOSTCTS`
: Lost Clear to Send signal.

`LMI_DEVERR`
: Start of device-specific error codes.

4.1.4 Initialization Service Primitives

Initialization service primitives allow the LMS user to enable or disable the protocol service interface. Enabling the protocol service interface may require that some action be taken to prepare the protocol service interface for use or to remove it from use. For example, where the PPA corresponds to a signalling data link identifier as defined in Q.704, it may be necessary to perform switching to connect or disconnect the circuit identification code associated with the signalling data link identifier.

These service primitives implement the initialization service (see Section 3.1.4 [Initialization Service], page 12).

4.1.4.1 LMI_ENABLE_REQ

Description

This LMS user originated primitive request that the LMS provider perform the actions necessary to enable the protocol service interface and confirm that it is enabled. This primitive is applicable to both styles of PPA.

Format

The enable request service primitive consists of one `M_PROTO` message block, structured as follows:

```
typedef struct {
    lmi_long lmi_primitive;
    lmi_uchar lmi_rem[0];
} lmi_enable_req_t;
```

Parameters

The enable request service primitive contains the following parameters:

`lmi_primitive`
: Specifies the service primitive type. Always `LMI_ENABLE_REQ`.

`lmi_rem`
: Specifies a remote address to which to connect the PPA. The need for and form of this address is provider-specific. The length of the field is determined by the length of the `M_PROTO` message block. This remote address could be a circuit identification code, an IP address, or some other form of circuit or channel identifier.

State

This primitive is valid in the `LMI_DISABLED` state and when no local acknowledgement is pending.

New State

Upon success the new state is `LMI_ENABLE_PENDING`. Upon failure, the state remains unchanged.

Response

The enable request service primitive requires that the LMS provider acknowledge receipt of the primitive as follows:

- **Successful**: When successful, the LMS provider acknowledges successful completion of the enable service with an `LMI_ENABLE_CON` primitive. The new state is `LMI_ENABLED`.
- **Unsuccessful (non-fatal errors)**: When unsuccessful, the LMS provider acknowledges the failure of the enable service wtih an `LMI_ERROR_ACK` primitive containing the error. The new state remains unchanged.

Reasons for Failure

Non-Fatal Errors: applicable non-fatal errors are as follows:

`LMI_UNSPEC`
: Unknown or unspecified.

`LMI_BADADDRESS`
: Address was invalid.

`LMI_BADADDRTYPE`
: Invalid address type.

`LMI_BADDIAL`
: (Not used.)

`LMI_BADDIALTYPE`
: (Not used.)

`LMI_BADDISPOSAL`
: Invalid disposal parameter.

`LMI_BADFRAME`
: Defective SDU received.

`LMI_BADPPA`
: Invalid PPA identifier.

`LMI_BADPRIM`
: Unrecognized primitive.

`LMI_DISC` Disconnected.

`LMI_EVENT`
: Protocol-specific event occurred.

`LMI_FATALERR`
: Device has become unusable.

`LMI_INITFAILED`
: Link initialization failed.

`LMI_NOTSUPP`
: Primitive not supported by this device.

`LMI_OUTSTATE`
: Primitive was issued from invalid state.

`LMI_PROTOSHORT`
: `M_PROTO` block too short.

`LMI_SYSERR`
: UNIX system error.

`LMI_WRITEFAIL`
: Unitdata request failed.

`LMI_CRCERR`
: CRC or FCS error.

`LMI_DLE_EOT`
: DLE EOT detected.

`LMI_FORMAT`
: Format error detected.

`LMI_HDLC_ABORT`
: Aborted frame detected.

`LMI_OVERRUN`
: Input overrun.

`LMI_TOOSHORT`
: Frame too short.

`LMI_INCOMPLETE`
: Partial frame received.

`LMI_BUSY` Telephone was busy.

`LMI_NOANSWER`
: Connection went unanswered.

`LMI_CALLREJECT`
: Connection rejected.

`LMI_HDLC_IDLE`
: HDLC line went idle.

`LMI_HDLC_NOTIDLE`
: HDLC link no longer idle.

`LMI_QUIESCENT`
: Line being reassigned.

`LMI_RESUMED`
: Line has been reassigned.

`LMI_DSRTIMEOUT`
: Did not see DSR in time.

`LMI_LAN_COLLISIONS`
: LAN excessive collisions.

`LMI_LAN_REFUSED`
: LAN message refused.

`LMI_LAN_NOSTATION`
: LAN no such station.

`LMI_LOSTCTS`
: Lost Clear to Send signal.

`LMI_DEVERR`
: Start of device-specific error codes.

4.1.4.2 LMI_ENABLE_CON

Description

This LMS provider originated primitive is issued by the LMS provider to confirm the successful completion of the enable service.

Format

The enable confirmation service primitive consists of one `M_PROTO` message block, structured as follows:

```
typedef struct {
    lmi_long lmi_primitive;
    lmi_ulong lmi_state;
} lmi_enable_con_t;
```

Parameters

The enable confirmation service primitive contains the following parameters:

`lmi_primitive`
: Indicates the service primitive type. Always `LMI_ENABLE_CON`.

`lmi_state`
: Indicates the state following issuing the enable confirmation primitive. This field can take on one of the following values:

  `LMI_ENABLED`
  : Ready for use, awaiting primitive exchange.

State

This primitive is issued by the LMS provider in the `LMI_ENABLE_PENDING` state.

New State

The new state is `LMI_ENABLED`.

4.1.4.3 LMI_DISABLE_REQ

Description

This LMS user originated primitive requests that the LMS provider perform the actions necessary to disable the protocol service interface and confirm that it is disabled. The primitive is applicable to both styles of PPA.

Format

The disable request service primitive consists of one `M_PROTO` message block, structured as follows:

```
typedef struct {
    lmi_long lmi_primitive;
} lmi_disable_req_t;
```

Parameters

The disable request service primitive contains the following parameters:

`lmi_primitive`
: Specifies the service primitive type. Always `LMI_DISABLE_REQ`.

State

The disable request service primitive is valid in the `LMI_ENABLED` state and when no local acknowledgement is pending.

New State

Upon success, the new state is `LMI_DISABLE_PENDING`. Upon failure, the state remains unchanged.

Response

The disable request service primitive requires the LMS provider to acknowledge receipt of the primitive as follows:

- **Successful**: When successful, the LMS provider acknowledges successful completion of the disable service with an `LMI_DISABLE_CON` primitive. The new state is `LMI_DISABLED`.
- **Unsuccessful (non-fatal errors)**: When unsuccessful, the LMS provider acknowledges the failure of the disable service with an `LMI_ERROR_ACK` primitive containing the error. The new state remains unchanged.

Reasons for Failure

Non-Fatal Errors: applicable non-fatal errors are as follows:

`LMI_UNSPEC`
: Unknown or unspecified.

`LMI_BADADDRESS`
: Address was invalid.

`LMI_BADADDRTYPE`
: Invalid address type.

`LMI_BADDIAL`
: (Not used.)

`LMI_BADDIALTYPE`
: (Not used.)

`LMI_BADDISPOSAL`
: Invalid disposal parameter.

`LMI_BADFRAME`
: Defective SDU received.

`LMI_BADPPA`
: Invalid PPA identifier.

`LMI_BADPRIM`
: Unrecognized primitive.

`LMI_DISC` Disconnected.

`LMI_EVENT`
: Protocol-specific event occurred.

`LMI_FATALERR`
: Device has become unusable.

`LMI_INITFAILED`
: Link initialization failed.

`LMI_NOTSUPP`
: Primitive not supported by this device.

`LMI_OUTSTATE`
: Primitive was issued from invalid state.

`LMI_PROTOSHORT`
: `M_PROTO` block too short.

`LMI_SYSERR`
: UNIX system error.

`LMI_WRITEFAIL`
: Unitdata request failed.

`LMI_CRCERR`
: CRC or FCS error.

`LMI_DLE_EOT`
: DLE EOT detected.

`LMI_FORMAT`
: Format error detected.

`LMI_HDLC_ABORT`
: Aborted frame detected.

`LMI_OVERRUN`
: Input overrun.

`LMI_TOOSHORT`
: Frame too short.

`LMI_INCOMPLETE`
: Partial frame received.

`LMI_BUSY` Telephone was busy.

`LMI_NOANSWER`
: Connection went unanswered.

`LMI_CALLREJECT`
: Connection rejected.

`LMI_HDLC_IDLE`
: HDLC line went idle.

`LMI_HDLC_NOTIDLE`
: HDLC link no longer idle.

`LMI_QUIESCENT`
: Line being reassigned.

`LMI_RESUMED`
: Line has been reassigned.

`LMI_DSRTIMEOUT`
: Did not see DSR in time.

`LMI_LAN_COLLISIONS`
: LAN excessive collisions.

`LMI_LAN_REFUSED`
: LAN message refused.

`LMI_LAN_NOSTATION`
: LAN no such station.

`LMI_LOSTCTS`
: Lost Clear to Send signal.

`LMI_DEVERR`
: Start of device-specific error codes.

4.1.4.4 LMI_DISABLE_CON

Description

This LMS provider originated primitive is issued by the LMS provider to confirm the successful completion of the disable service.

Format

The disable confirmation service primitive consists of one `M_PROTO` message block, structured as follows:

```
typedef struct {
    lmi_long lmi_primitive;
    lmi_ulong lmi_state;
} lmi_disable_con_t;
```

Parameters

The disable confirmation service primitive contains the following parameters:

`lmi_primitive`
: Indicates the service primitive type. Always `LMI_DISABLE_CON`.

`lmi_state`
: Indicates the state following issuing the disable confirmation primitive. This field can take on one of the following values:

  `LMI_DISABLED`
  : PPA attached, awaiting `LMI_ENABLE_REQ`.

State

This primitive is issued by the LMS provider in the `LMI_DISABLE_PENDING` state.

New State

The new state is `LMI_DISABLED`.

4.1.5 Options Management Service Primitives

The options management service primitives allow the LMS user to negotiate options with the LMS provider, retrieve the current and default values of options, and check that values specified for options are correct.

The options management service primitive implement the options management service (see Section 3.1.5 [Options Management Service], page 13).

4.1.5.1 LMI_OPTMGMT_REQ

Description

This LMS user originated primitive requests that LMS provider options be managed.

Format

The option management request service primitive consists of one `M_PROTO` or `M_PCPROTO` message block, structured as follows:

```
typedef struct {
    lmi_long lmi_primitive;
    lmi_ulong lmi_opt_length;
    lmi_ulong lmi_opt_offset;
    lmi_ulong lmi_mgmt_flags;
} lmi_optmgmt_req_t;
```

Parameters

The option management request service primitive contains the following parameters:

`lmi_primitive`
: Specifies the service primitive type. Always `LMI_OPTMGMT_REQ`.

`lmi_opt_length`
: Specifies the length of the options.

`lmi_opt_offset`
: Specifies the offset, from the beginning of the `M_PROTO` message block, of the start of the options.

`lmi_mgmt_flags`
: Specifies the management flags which determine what operation the LMS provider is expected to perform on the specified options. This field can assume one of the following values:

  `LMI_NEGOTIATE`
  : Negotiate the specified value of each specified option and return the negotiated value.

  `LMI_CHECK`
  : Check the validity of the specified value of each specified option and return the result. Do not alter the current value assumed by the LMS provider.

`LMI_DEFAULT`
: Return the default value for the specified options (or all options). Do not alter the current value assumed by the LMS provider.

`LMI_CURRENT`
: Return the current value for the specified options (or all options). Do not alter the current value assumed by the LMS provider.

State

This primitive is valid in any state where a local acknowledgement is not pending.

New State

The new state remains unchanged.

Response

The option management request service primitive requires the LMS provider to acknowledge receipt of the primitive as follows:

- **Successful**: Upon success, the LMS provider acknowledges receipt of the service primitive and successful completion of the options management service with an `LMI_OPTMGMT_ACK` primitive containing the options management result. The state remains unchanged.
- **Unsuccessful (non-fatal errors)**: Upon failure, the LMS provider acknowledges receipt of the service primitive and failure to complete the options management service with an `LMI_ERROR_ACK` primitive containing the error. The state remains unchanged.

Reasons for Failure

Non-Fatal Errors: applicable non-fatal errors are as follows:

`LMI_UNSPEC`
: Unknown or unspecified.

`LMI_BADADDRESS`
: Address was invalid.

`LMI_BADADDRTYPE`
: Invalid address type.

`LMI_BADDIAL`
: (Not used.)

`LMI_BADDIALTYPE`
: (Not used.)

`LMI_BADDISPOSAL`
: Invalid disposal parameter.

`LMI_BADFRAME`
: Defective SDU received.

`LMI_BADPPA`
: Invalid PPA identifier.

`LMI_BADPRIM`
: Unrecognized primitive.

`LMI_DISC` Disconnected.

`LMI_EVENT`
: Protocol-specific event occurred.

`LMI_FATALERR`
: Device has become unusable.

`LMI_INITFAILED`
: Link initialization failed.

`LMI_NOTSUPP`
: Primitive not supported by this device.

`LMI_OUTSTATE`
: Primitive was issued from invalid state.

`LMI_PROTOSHORT`
: `M_PROTO` block too short.

`LMI_SYSERR`
: UNIX system error.

`LMI_WRITEFAIL`
: Unitdata request failed.

`LMI_CRCERR`
: CRC or FCS error.

`LMI_DLE_EOT`
: DLE EOT detected.

`LMI_FORMAT`
: Format error detected.

`LMI_HDLC_ABORT`
: Aborted frame detected.

`LMI_OVERRUN`
: Input overrun.

`LMI_TOOSHORT`
: Frame too short.

`LMI_INCOMPLETE`
: Partial frame received.

`LMI_BUSY` Telephone was busy.

`LMI_NOANSWER`
: Connection went unanswered.

`LMI_CALLREJECT`
: Connection rejected.

`LMI_HDLC_IDLE`
: HDLC line went idle.

`LMI_HDLC_NOTIDLE`
: HDLC link no longer idle.

`LMI_QUIESCENT`
: Line being reassigned.

`LMI_RESUMED`
: Line has been reassigned.

`LMI_DSRTIMEOUT`
: Did not see DSR in time.

`LMI_LAN_COLLISIONS`
: LAN excessive collisions.

`LMI_LAN_REFUSED`
: LAN message refused.

`LMI_LAN_NOSTATION`
: LAN no such station.

`LMI_LOSTCTS`
: Lost Clear to Send signal.

`LMI_DEVERR`
: Start of device-specific error codes.

4.1.5.2 LMI_OPTMGMT_ACK

Description

This LMS provider originated primitive is issued by the LMS provider upon successful completion of the options management service. It indicates the outcome of the options management operation requested by the LMS user in a `LMI_OPTMGMT_REQ` primitive.

Format

The option management acknowledgement service primitive consists of one `M_PCPROTO` message block, structured as follows:

```
typedef struct {
    lmi_long lmi_primitive;
    lmi_ulong lmi_opt_length;
    lmi_ulong lmi_opt_offset;
    lmi_ulong lmi_mgmt_flags;
} lmi_optmgmt_ack_t;
```

Parameters

The option management acknowledgement service primitive contains the following parameters:

`lmi_primitive`
: Indicates the service primitive type. Always `LMI_OPTMGMT_ACK`.

`lmi_opt_length`
: Indicates the length of the returned options.

`lmi_opt_offset`
: Indicates the offset of the returned options from the start of the `M_PCPROTO` message block.

`lmi_mgmt_flags`
: Indicates the returned management flags. These flags indicate the overall success of the options management service. This field can assume one of the following values:

  `LMI_SUCCESS`
  : The LMS provider succeeded in negotiating or returning all of the options specified by the LMS user in the `LMI_OPTMGMT_REQ` primitive.

  `LMI_FAILURE`
  : The LMS provider failed to negotiate one or more of the options specified by the LMS user.

  `LMI_PARTSUCCESS`
  : The LMS provider negotiated a value of lower quality for one or more of the options specified by the LMS user.

`LMI_READONLY`
: The LMS provider failed to negotiate one ore more of the options specified by the LMS user because the option is treated as read-only by the LMS provider.

`LMI_NOTSUPPORT`
: The LMS provider failed to recognize one or more of the options specified by the LMS user.

State

This primitive is issued by the LMS provider in direct response to an `LMI_OPTMGMT_REQ` primitive.

New State

The new state remains unchanged.

Rules

The LMS provider follows the following rules when processing option management service requests:

— When the `lmi_mgmt_flags` field in the `LMI_OPTMGMT_REQ` primitive is set to `LMI_NEGOTIATE`, the LMS provider will attempt to negotiate a value for each of the options specified in the request.

— When the flags are `LMI_DEFAULT`, the LMS provider will return the default values of the specified options, or the default values of all options known to the LMS provider if no options were specified.

— When the flags are `LMI_CURRENT`, the LMS provider will return the current values of the specified options, or all options.

— When the flags are `LMI_CHECK`, the LMS provider will attempt to negotiate a value for each of the options specified in the request and return the resulg of the negotiation, but will not affect the current value of the option.

4.1.6 Event Reporting Service Primitives

The event reporting service primitives allow the LMS provider to indicate asynchronous errors, events and statistics collection to the LMS user.

These service primitives implement the event reporting service (see Section 3.1.8 [Event Reporting Service], page 15).

4.1.6.1 LMI_ERROR_IND

Description

This LMS provider originated service primitive is issued by the LMS provider when it detects and asynchronous error event. The service primitive is applicable to all styles of PPA.

Format

The error indication service primitive consists of one `M_PROTO` message block, structured as follows:

```
typedef struct {
    lmi_long lmi_primitive;
    lmi_ulong lmi_errno;
    lmi_ulong lmi_reason;
    lmi_ulong lmi_state;
} lmi_error_ind_t;
```

Parameters

The error indication service primitive contains the following parameters:

`lmi_primitive`
: Indicates the service primitive type. Always `LMI_ERROR_IND`.

`lmi_errno`
: Indicates the LMI error number describing the error. This field can have one of the following values:

  `LMI_UNSPEC`
  : Unknown or unspecified.

  `LMI_BADADDRESS`
  : Address was invalid.

  `LMI_BADADDRTYPE`
  : Invalid address type.

  `LMI_BADDIAL`
  : (Not used.)

  `LMI_BADDIALTYPE`
  : (Not used.)

`LMI_BADDISPOSAL`
: Invalid disposal parameter.

`LMI_BADFRAME`
: Defective SDU received.

`LMI_BADPPA`
: Invalid PPA identifier.

`LMI_BADPRIM`
: Unrecognized primitive.

`LMI_DISC` Disconnected.

`LMI_EVENT`
: Protocol-specific event occurred.

`LMI_FATALERR`
: Device has become unusable.

`LMI_INITFAILED`
: Link initialization failed.

`LMI_NOTSUPP`
: Primitive not supported by this device.

`LMI_OUTSTATE`
: Primitive was issued from invalid state.

`LMI_PROTOSHORT`
: `M_PROTO` block too short.

`LMI_SYSERR`
: UNIX system error.

`LMI_WRITEFAIL`
: Unitdata request failed.

`LMI_CRCERR`
: CRC or FCS error.

`LMI_DLE_EOT`
: DLE EOT detected.

`LMI_FORMAT`
: Format error detected.

`LMI_HDLC_ABORT`
: Aborted frame detected.

`LMI_OVERRUN`
: Input overrun.

`LMI_TOOSHORT`
: Frame too short.

`LMI_INCOMPLETE`
: Partial frame received.

`LMI_BUSY` Telephone was busy.

`LMI_NOANSWER`
: Connection went unanswered.

`LMI_CALLREJECT`
: Connection rejected.

`LMI_HDLC_IDLE`
: HDLC line went idle.

`LMI_HDLC_NOTIDLE`
: HDLC link no longer idle.

`LMI_QUIESCENT`
: Line being reassigned.

`LMI_RESUMED`
: Line has been reassigned.

`LMI_DSRTIMEOUT`
: Did not see DSR in time.

`LMI_LAN_COLLISIONS`
: LAN excessive collisions.

`LMI_LAN_REFUSED`
: LAN message refused.

`LMI_LAN_NOSTATION`
: LAN no such station.

`LMI_LOSTCTS`
: Lost Clear to Send signal.

`LMI_DEVERR`
: Start of device-specific error codes.

`lmi_reason`
: Indicates the reason for failure. This field is protocol-specific. When the `lmi_errno` field is `LMI_SYSERR`, the `lmi_reason` field is the UNIX error number as described in `errno(3)`.

`lmi_state`
: Indicates the state of the LMS provider at the time that the primitive was issued. This field can have one of the following values:

`LMI_UNATTACHED`
: No PPA attached, awaiting `LMI_ATTACH_REQ`.

`LMI_ATTACH_PENDING`
: Waiting for attach.

`LMI_UNUSABLE`
: Device cannot be used, STREAM in hung state.

`LMI_DISABLED`
: PPA attached, awaiting `LMI_ENABLE_REQ`.

`LMI_ENABLE_PENDING`
: Waiting to send `LMI_ENABLE_CON`.

`LMI_ENABLED`
: Ready for use, awaiting primitive exchange.

`LMI_DISABLE_PENDING`
: Waiting to send `LMI_DISABLE_CON`.

`LMI_DETACH_PENDING`
: Waiting for detach.

State

This primitive can be issued in any state for which a local acknowledgement is not pending. The LMS provider state at the time that the primitive was issued is indicated in the primitive.

New State

The new state remains unchanged.

4.1.6.2 LMI_STATS_IND

Description

This LMS provider originated primitive is issued by the LMS provider to indicate a periodic statistics collection event. The service primitive is applicable to all styles of PPA.

Format

The statistics indication service primitive consists of one `M_PROTO` message block, structured as follows:

```
typedef struct {
    lmi_long lmi_primitive;
    lmi_ulong lmi_interval;
    lmi_ulong lmi_timestamp;
} lmi_stats_ind_t;
```

Following this structure within the `M_PROTO` message block is the provider-specific statistics.

Parameters

The statistics indication service primitive contains the following parameters:

`lmi_primitive`
: Indicates the service primitive type. Always `LMI_STATS_IND`.

`lmi_interval`
: Indicates the statistics collection interval to which the statistics apply. This interval is specified in milliseconds.

`lmi_timestamp`
: Indicates the UNIX time (from epoch) at which statistics were collected. The timestamp is given in milliseconds from epoch.

State

This service primitive may be issued by the LMS provider in any state in which a local acknowledgement is not pending.

New State

The new state remains unchanged.

4.1.6.3 LMI_EVENT_IND

Description

This LMS provider originated primitive is issued by the LMS provider to indicate an asynchronous event. The service primitive is applicable to all styles of PPA.

Format

The event indication service primitive consists of one `M_PROTO` message block, structured as follows:

```
typedef struct {
    lmi_long lmi_primitive;
    lmi_ulong lmi_objectid;
    lmi_ulong lmi_timestamp;
    lmi_ulong lmi_severity;
} lmi_event_ind_t;
```

Following this structure within the `M_PROTO` message block is the provider-specific event information.

Parameters

THe event indication service primitive contains the following parameters:

`lmi_primitive`
: Indicates the service primitive type. Always `LMI_EVENT_IND`.

`lmi_objectid`
: Indicates the provider-specific object identifier that identifies the managed object to which the event is associated.

`lmi_timestamp`
: Indicates the UNIX time from epoch (in milliseconds).

`lmi_severity`
: Indicates the provider-specific severity of the event.

State

This service primitive can be issued by the LMS provider in any state where a local acknowledgement is not pending. Normally the LMS provider must be in the `LMI_ENABLED` state for event reporting to occur.

New State

The new state remains unchanged.

4.2 Protocol Service Primitives

Protocol service primitives implement the Signalling Data Link Interface protocol. Protocol service primitives provide the SDLS user with the ability to connect transmission or reception directions of the bit stream, pass bits for transmission and accept recevied bits.

These service primitives implement the protocol services (see Section 3.2 [Protocol Services], page 15).

4.2.1 Connection Service Primitives

The connection service primitives permit the SDLS user to establish a connection between the line (circuit or channel) and the SDLS user in the transmit, receive, or both, directions.

These service primitives implement the connection service (see Section 3.2.1 [Connection Service], page 15).

4.2.1.1 SDL_CONNECT_REQ

Description

This SDLS user originated service primitive allows the SDLS user to connect the user stream to the medium in the transmit, receive, or both, directions.

Format

The connect request primitive consists of one `M_PROTO` message block, structured as follows:

```
typedef struct {
    sdl_long sdl_primitive;
    sdl_ulong sdl_flags;
} sdl_connect_req_t;
```

Parameters

The connect request service primitive contains the following parameters:

`sdl_primitive`
: Specifies the service primitive type. Always `SDL_CONNECT_REQ`.

`sdl_flags`
: Specifies the direction in which to connect. This field can contain a bitwise OR of one or more of the following flags:

  `SDL_RX_DIRECTION`
  : Specifies that the SDLS user stream is to be connected to the medium in the receive direction.

  `SDL_TX_DIRECTION`
  : Specifies that the SDLS user stream is to be connected to the medium in the transmit direction.

State

This service primitive is only valid in the `LMI_ENABLED` state.

New State

The state remains unchanged.

Response

The connection request service primitive is not acknowledged. However, the primitive may result in a non-fatal error as follows:

- **Successful:** Upon success, the connection request service primitive is not acknowledged.
- **Unsuccessful (non-fatal errors):** Upon failure, the SDLS provider indicates a non-fatal error with a `LMI_ERROR_ACK` message containing the error.

Reasons for Failure

4.2.2 Data Transfer Service Primitives

The data transfer service primitives permit the SDLS user to pass bits for transmission to the SDLS provider and accept received bits from the SDLS provider.

These service primitives implement the data transfer service (see Section 3.2.2 [Data Transfer Service], page 16).

4.2.2.1 SDL_BITS_FOR_TRANSMISSION_REQ

Description

This SDLS user originated primitive allows the SDLS user to specify bits for transmission on the medium.

Format

The transmission request service primitive consists of one optional `M_PROTO` message block followed by one or more `M_DATA` message blocks containing the bits for transmission. The `M_PROTO` message block is structured as follows:

```
typedef struct {
    sdl_long sdl_primitive;
} sdl_bits_for_transmission_req_t;
```

Parameters

The transmission request service primitive contains the following parameters:

`sdl_primitive`
: Specifies the service primitive type. Always `SDL_BITS_FOR_TRANSMISSION_REQ`.

State

This primitive is only valid in the `LMI_ENABLED` state.

New State

The state remains unchanged.

Response

Reasons for Failure

4.2.2.2 SDL_RECEIVED_BITS_IND

Description

This SDLS provider originated primitive is issued by the SDLS provider to indicate bits that were received on the medium.

Format

The receive indication service primitive consists of one optional `M_PROTO` message block followed by one or more `M_DATA` message blocks containing the received bits. The `M_PROTO` message block is structured as follows:

```
typedef struct {
    sdl_long sdl_primitive;
} sdl_received_bits_ind_t;
```

Parameters

The receive indication service primitive contains the following parameters:

`sdl_primitive`
: Indicates the service primitive type. Always `SDL_RECEIVED_BITS_IND`.

State

This primitive is only issued by the SDLS provider in the `LMI_ENABLED` state.

New State

The state remains unchanged.

Response

Reasons for Failure

4.2.3 Disconnection Service Primitives

The disconnection service primitives permit the SDLS user to disconnect the stream from the line (circuit or channel) for the transmit, receive, or both, directions. They also alow the SDLS provider to indicate that a disconnection has occured outside of SDLS user control.

These service primitives implement the disconnection service (see Section 3.2.3 [Disconnection Service], page 16).

4.2.3.1 SDL_DISCONNECT_REQ

Description

This SDLS user originated service primitive allow the SDLS user to disconnect the SDLS user stream from the bit-stream in the transmit, receive, or both, directions.

Format

The disconnect request primitive consists of one `M_PROTO` message block, structured as follows:

```
typedef struct {
    sdl_long sdl_primitive;
    sdl_ulong sdl_flags;
} sdl_disconnect_req_t;
```

Parameters

The disconnect request service primitive contains the following parameters:

`sdl_primitive`
: Specifies the service primitive type. Always `SDL_DISCONNECT_REQ`.

`sdl_flags`
: Specifies the direction from which to disconnect. This field can be a bitwise OR of one or more of the following flags:

  `SDL_RX_DIRECTION`
  : Specifies that the SDLS user stream is to be disconnected from the medium in the receive direction.

  `SDL_TX_DIRECTION`
  : Specifies that the SDLS user stream is to be disconnected from the medium in the transmit direction.

State

This service primitive is only valid in the `LMI_ENABLED` state.

New State

The state remains unchanged.

Response

Reasons for Failure

4.2.3.2 SDL_DISCONNECT_IND

Description

This SDLS provider originated primitive is issued by the SDLS provider if an autonomous event results in the disconnection of the transmit and receive bit-streams from the SDLS user without an explicit SDLS user request.

Format

The disconnect indication primitive consists of one `M_PROTO` message block, structured as follows:

```
typedef struct {
    sdl_long sdl_primitive;
} sdl_disconnect_ind_t;
```

Parameters

State

New State

Response

Reasons for Failure

5 Diagnostics Requirements

Two error handling facilities should be provided to the SDLS user: one to handle non-fatal errors, and the other to handle fatal errors.

5.1 Non-Fatal Error Handling Facility

These are errors that do not change the state of the SDLS interface as seen by the SDLS user and provide the user with the option of reissuing the SDL primitive with the corrected options specification. The non-fatal error handling is provided only to those primitives that require acknowledgements, and uses the `LMI_ERROR_ACK` to report these errors. These errors retain the state of the SDLS interface the same as it was before the SDL provider received the primitive that was in error. Syntax errors and rule violations are reported via the non-fatal error handling facility.

5.2 Fatal Error Handling Facility

These errors are issued by the SDL provider when it detects errors that are not correctable by the SDL user, or if it is unable to report a correctible error to the SDLS user. Fatal errors are indicated via the STREAMS message type `M_ERROR` with the UNIX system error `EPROTO`. The `M_ERROR` STREAMS message type will result in the failure of all the UNIX system calls on the stream. The SDLS user can recover from a fatal error by having all the processes close the files associated with the stream, and then reopening them for processing.

 U.S. GOVERNMENT RESTRICTED RIGHTS.  If you are licensing this Software on
 behalf of the U.S. Government ("Government"), the following provisions apply
 to you.  If the Software is supplied by the Department of Defense ("DoD"), it
 is classified as "Commercial Computer Software" under paragraph 252.227-7014
 of the DoD Supplement to the Federal Acquisition Regulations ("DFARS") (or any
 successor regulations) and the Government is acquiring only the license rights
 granted herein (the license rights customarily provided to non-Government
 users).  If the Software is supplied to any unit or agency of the Government
 other than DoD, it is classified as "Restricted Computer Software" and the
 Government's rights in the Software are defined in paragraph 52.227-19 of the
 Federal Acquisition Regulations ("FAR") (or any successor regulations) or, in
 the cases of NASA, in paragraph 18.52.227-86 of the NASA Supplement to the FAR
 (or any successor regulations).

GNU Free Documentation License

GNU FREE DOCUMENTATION LICENSE
Version 1.1, March 2000

Preamble

The purpose of this License is to make a manual, textbook, or other written document *free* in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondarily, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

Terms and Conditions for Copying, Distribution and Modification

1. APPLICABILITY AND DEFINITIONS

   This License applies to any manual or other work that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. The "Document", below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as "you".

   A "Modified Version" of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

   A "Secondary Section" is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (For example, if the Document is in part a

textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License.

The "Cover Texts" are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License.

A "Transparent" copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, whose contents can be viewed and edited directly and straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup has been designed to thwart or discourage subsequent modification by readers is not Transparent. A copy that is not "Transparent" is called "Opaque".

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML designed for human modification. Opaque formats include PostScript, PDF, proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML produced by some word processors for output purposes only.

The "Title Page" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

2. VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

3. COPYING IN QUANTITY

   If you publish printed copies of the Document numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

   If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

   If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a publicly-accessible computer-network location containing a complete Transparent copy of the Document, free of added material, which the general network-using public has access to download anonymously at no charge using public-standard network protocols. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

   It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

4. MODIFICATIONS

   You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

   A. Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.

   B. List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has less than five).

   C. State on the Title page the name of the publisher of the Modified Version, as the publisher.

   D. Preserve all the copyright notices of the Document.

E. Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.

F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.

G. Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.

H. Include an unaltered copy of this License.

I. Preserve the section entitled "History", and its title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.

J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the "History" section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.

K. In any section entitled "Acknowledgments" or "Dedications", preserve the section's title, and preserve in the section all the substance and tone of each of the contributor acknowledgments and/or dedications given therein.

L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.

M. Delete any section entitled "Endorsements". Such a section may not be included in the Modified Version.

N. Do not retitle any existing section as "Endorsements" or to conflict in title with any Invariant Section.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties—for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be

added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

5. COMBINING DOCUMENTS

   You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice.

   The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

   In the combination, you must combine any sections entitled "History" in the various original documents, forming one section entitled "History"; likewise combine any sections entitled "Acknowledgments", and any sections entitled "Dedications". You must delete all sections entitled "Endorsements."

6. COLLECTIONS OF DOCUMENTS

   You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

   You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

7. AGGREGATION WITH INDEPENDENT WORKS

   A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, does not as a whole count as a Modified Version of the Document, provided no compilation copyright is claimed for the compilation. Such a compilation is called an "aggregate", and this License does not apply to the other self-contained works thus compiled with the Document, on account of their being thus compiled, if they are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one quarter of the entire aggregate, the Document's Cover Texts may be placed on covers that surround only the Document within the aggregate. Otherwise they must appear on covers around the whole aggregate.

8. TRANSLATION

   Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License provided that you also include the original English version of this License. In case of a disagreement between the translation and the original English version of this License, the original English version will prevail.

9. TERMINATION

   You may not copy, modify, sublicense, or distribute the Document except as expressly provided for under this License. Any other attempt to copy, modify, sublicense or distribute the Document is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

10. FUTURE REVISIONS OF THIS LICENSE

    The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See http://www.gnu.org/copyleft/.

    Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License "or any later version" applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation.

END OF TERMS AND CONDITIONS

How to use this License for your documents

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

> Copyright (C) *year your name*.
> Permission is granted to copy, distribute and/or modify this document
> under the terms of the GNU Free Documentation License, Version 1.1
> or any later version published by the Free Software Foundation;
> with the Invariant Sections being *list their titles*, with the
> Front-Cover Texts being *list*, and with the Back-Cover Texts being *list*.
> A copy of the license is included in the section entitled ‘‘GNU
> Free Documentation License’’.

If you have no Invariant Sections, write “with no Invariant Sections” instead of saying which ones are invariant. If you have no Front-Cover Texts, write “no Front-Cover Texts” instead of “Front-Cover Texts being *list*”; likewise for Back-Cover Texts.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.

Glossary

Signalling Data Link Service Data Unit
: A grouping of SDL user data whose boundaries are preserved from one end of the signalling data link connection to the other.

Data transfer
: The phase in connection and connectionless modes that supports the transfer of data between to signalling data link users.

SDL provider
: The signalling data link layer protocol that provides the services of the signalling data link interface.

SDL user
: The user-level application or user-level or kernel-level protocol that accesses the services of the signalling data link layer.

Local management
: The phase in connection and connectionless modes in which a SDL user initializes a stream and attaches a PPA address to the stream. Primitives in this phase generate local operations only.

PPA
: The point at which a system attaches itself to a physical communications medium.

PPA identifier
: An identifier of a particular physical medium over which communication transpires.

Acronyms

ITU-T	International Telecommunications Union - Telecom Sector
LM	Local Management
LMS	Local Management Service
LMS Provider	A provider of Local Management Services
LMS User	A user of Local Management Services
PPA	Physical Point of Attachment
SDL	Signalling Data Link
SDL SDU	Signalling Data Link Service Data Unit
SDLI	Signalling Data Link Interface
SDLS	Signalling Data Link Service
SDT	Signalling Data Terminal
SDTI	Signalling Data Terminal Interface
SDTS	Signalling Data Terminal Service
SL	Signalling Link
SLI	Signalling Link Interface
SLS	Signalling Link Service
SS7	Signalling System No. 7
